Program Name: Clothing Store

Category: Linked List

Program Description:
The Clothing Store program is a simple desktop-based ordering system that simulates how a customer selects clothing items in a store.
It allows users to navigate through different screens, choose product categories, select specific items, and complete an order that results in a receipt.
The program is designed to demonstrate:

- Menu navigation
- Item selection using categories
- Order creation
- Receipt generation

It follows a step-by-step shopping flow, similar to a basic point-of-sale or online shopping interface.

Scope and Limitations:
Scope

- Display a home screen with basic navigation options
- Allow users to start or exit the ordering process
- Display available items organized by category
- Let users select items and add them to an order
- Allow multiple items to be added before checkout
- Generate a receipt showing selected items and total price
- Return the user back to the home screen after completing an order

Limitations

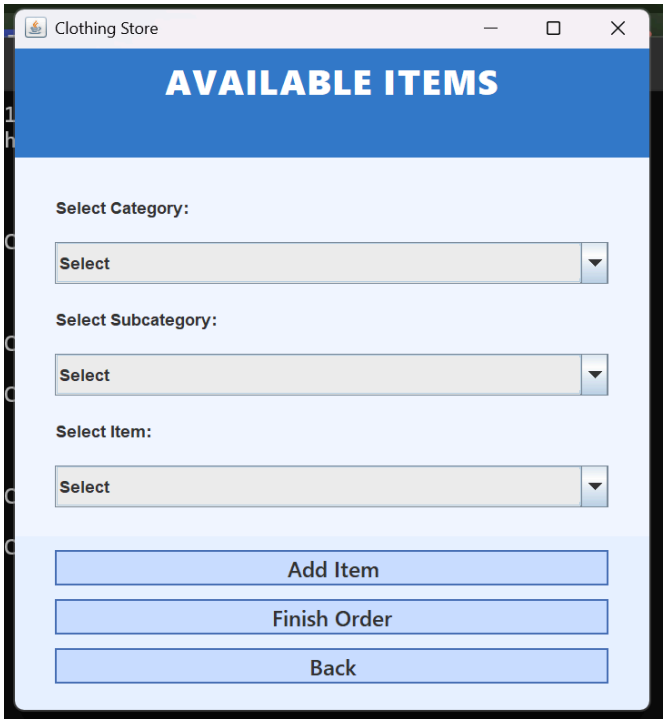
- Does not process real payments
- Does not track customer information
- Does not update stock quantities dynamically
- Does not save orders permanently (orders reset when returning home)
- Does not allow item removal once added
- Is intended for educational or demonstration purposes only

Clear Layout and Output Explanation:

A. Home Screen
Purpose:
This screen serves as the main entry point of the application.
Layout Explanation:
- The title "CLOTHING STORE" is centered and prominently displayed to clearly indicate the program's purpose.

- Two buttons are placed at the center:
  - Start Ordering – begins the ordering process
  - Exit – closes the application
- The layout is simple and uncluttered, allowing users to easily understand their choices.

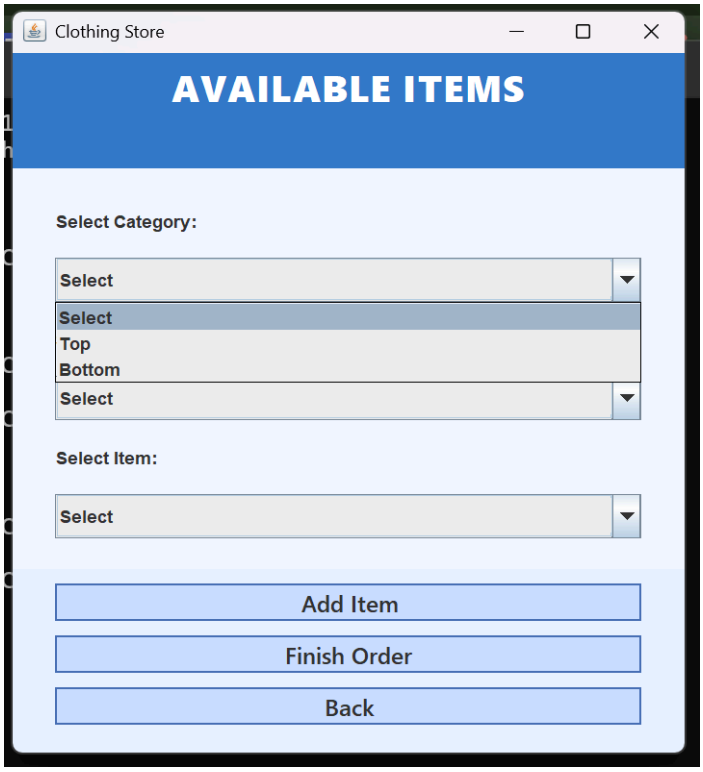
User Interaction:
- Clicking Start Ordering moves the user to the item selection screen.
- Clicking Exit immediately closes the program.



B. Available Items Screen – Default View
Purpose:
This screen allows the user to browse and select items for purchase.
Layout Explanation:
- A header labeled "AVAILABLE ITEMS" appears at the top, clearly indicating the function of the screen.
- Three labeled dropdown sections guide the user:
  - Select Category
  - Select Subcategory
  - Select Item
- Action buttons are placed at the bottom:
  - Add Item – adds the selected item to the order
  - Finish Order – proceeds to checkout

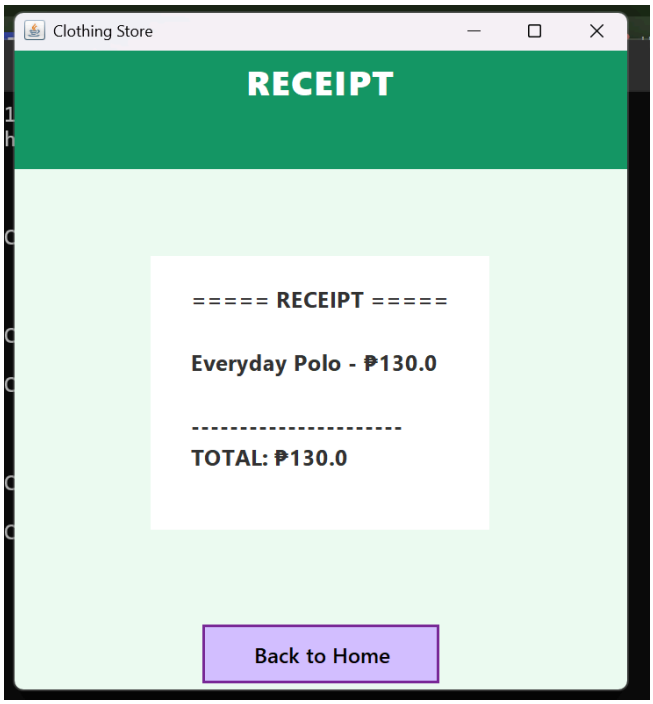
- Back – returns to the home screen

User Interaction:
- The user must select options in order.
- Buttons are inactive in function until a valid selection is made.



C. Category Selection View
Purpose:
This view shows how categories are chosen before selecting items.
Layout Explanation:
- The Select Category dropdown expands to show available choices (e.g., Top, Bottom).
- Other selection fields remain unchanged until a category is chosen.
- This enforces a guided selection flow, preventing incorrect item selection.

User Interaction:
- Choosing a category unlocks related options in the next selection field.
- This ensures items are filtered correctly based on the user's choice.



D. Receipt Page
Purpose:
The Receipt Page displays a summary of the customer's selected items, along with their quantities, individual prices, and the total amount due. It serves as the final confirmation before the user completes the order and returns to the home screen.
Layout Explanation:
1. Header:
- A label,"RECEIPT", is displayed at the top of the page.
- The header is centered both vertically and horizontally for clear visibility and aesthetic balance.
2. Order Details Section:
- A list format shows each selected item.

    - Item Name – the name of the selected clothing item.
    - Price – the cost of each item.
3. Total Amount:
- Displayed at the bottom of the order list.
- Show the total price of all items combined.
- Example: “TOTAL: ₱1,250.00”

4. Action Buttons:
    - Back to Home – returns the user to the Home Screen, resetting the order.

User Interaction:
- Users review their selected items and confirm the purchase by noting the total price.
- Clicking Back to Home returns the user to the main screen and clears the current order, preparing the system for a new transaction.
- No further editing of the order is allowed at this stage, reinforcing the finality of the receipt.

Additional Notes:
- The Receipt Page acts as a visual summary of the transaction.
- Using a Linked List structure in the backend allows dynamic storage of selected items, ensuring that all items added in the order are accurately displayed on the receipt.
- Proper spacing and alignment are key to readability, making it easy for users to check their order at a glance.

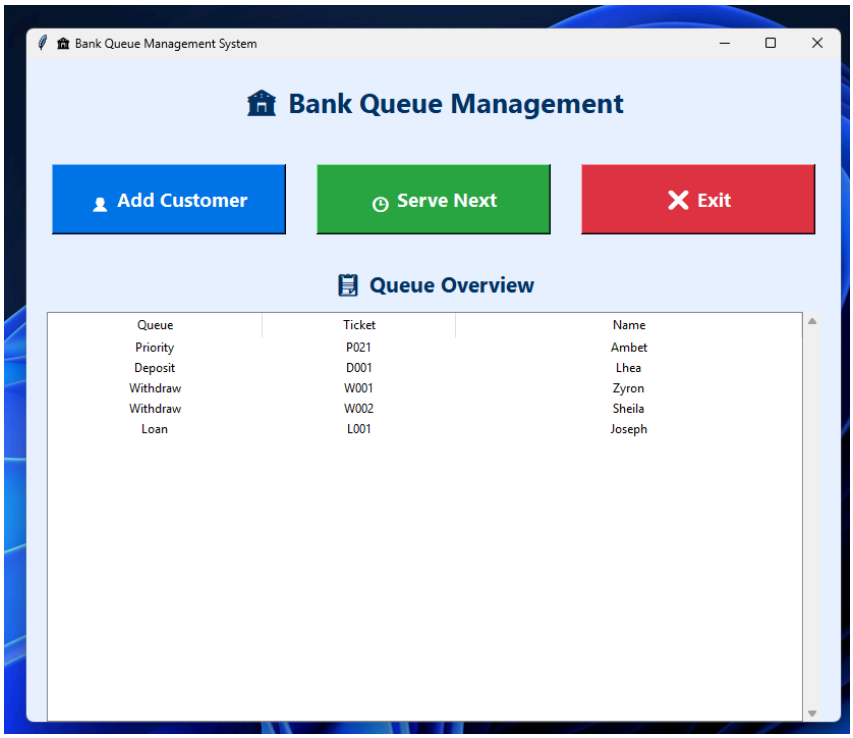
Project Name:
Bank Queue Management System

Category:
Queue

Description:
A desktop application built with Python (Tkinter) that simulates a bank's customer queue system. It manages Priority and Regular customers across multiple teller types (Deposit, Withdraw, Loan).
The system generates tickets, displays queues in tables, and serves customers in order with priority handling.

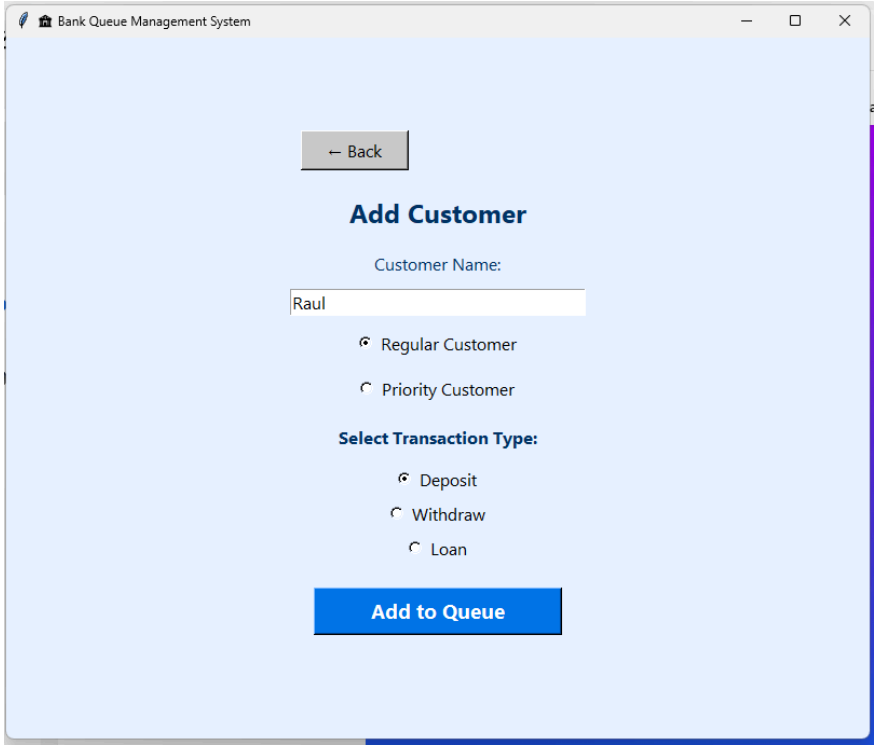
Scope:
- Customer Registration: Add Priority or Regular customers with names and transaction types.
- Ticket Generation: Auto-generate formatted tickets (e.g., P021, D001, W004, L065).
- Queue Management: Separate queues for Priority, Deposit, Withdraw, and Loan.
- Serving Logic: Priority customers served first, then regular teller queues.
- Dashboard Display: Real-time table showing all customers waiting.
- Statistics: Total customers, per-queue counts.

Limitations:
- Single branch simulation (no multi-branch support).
- No persistent database (data resets when program closes).
- Limited to three teller types (Deposit, Withdraw, Loan).
- No networking or online integration.

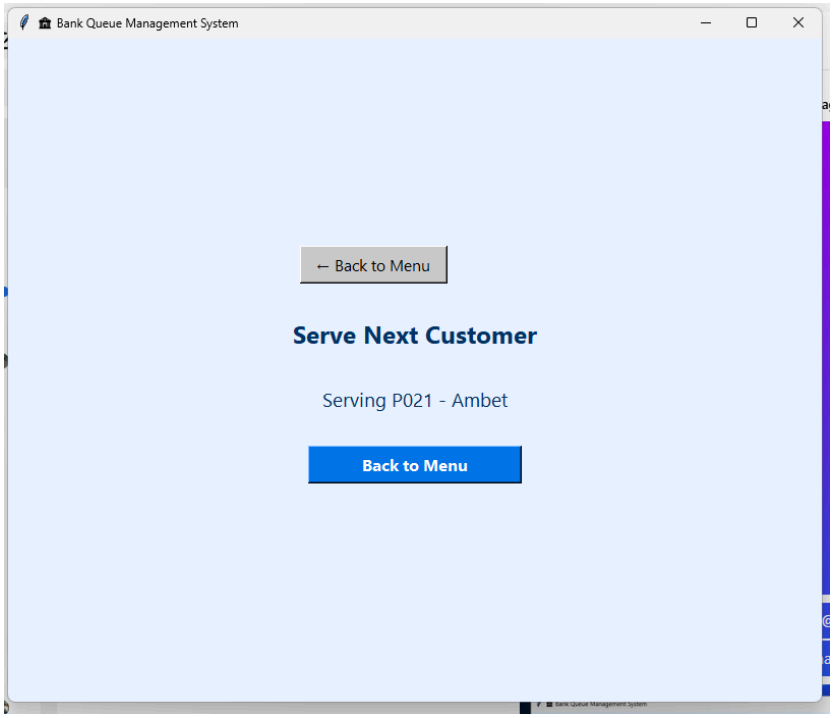


Clear Layout with Explanation & Outputs:

Layout 1: Main Menu Dashboard
- Buttons: Add Customer, Serve Next, Exit.
- Live queue summary (total customers, per-queue counts).
- Scrollable table showing all customers (Ticket, Name, Queue).



Layout 2: Add Customer Screen
- Input: Customer Name.
- Radio buttons: Regular or Priority.
- Transaction type selection: Deposit, Withdraw, Loan.
- Button: Add to Queue.



Layout 3: Serve Next Screen
- Shows the next customer being served.
- Priority queue checked first, then teller queues.
- Updates dashboard after serving.

Main Database Content (Table Format)
(Data depends on user input)
| Ticket Format | Queue Type | Customer Name | Transaction

Project name:
Valenzuela Utility Finder

Category:
Graph / Map-based GUI proposal
(A location-aware mapping application with ranked nearest utility companies and routing.)

Description:

1. User opens the app (first GUI panel). They select a Utility (Electricity or Water) and a Company (Meralco, TransCo, Maynilad, Valenzuela Water) — or choose Show All Companies.
2. After selecting utility (and optionally company), proceed to the second panel where the user enters Last Name, First Name, Middle Name, and selects a location (one of Valenzuela's 33 barangays).
3. The map loads and shows:
   - User's current location (blue marker).
   - The nearest matching utility company (green marker).
   - Second-best (yellow marker).
   - Third-best (red marker).
   - A side panel lists the recommended 1st / 2nd / 3rd companies (name, distance, brief contact/info).
4. When the user clicks any company marker, the app draws a route from the user's location to that company. The user can click anywhere else on the map to place a marker and request routing there as well.
5. A Find this utility button finalizes the selection; the app displays a confirmation ("Thank you — the route to this utility has been found"), and then returns the user to the first main panel.

- Key behaviors:
  - If Show All Companies is selected, the map displays all companies that provide the chosen utility and still ranks the nearest three.
  - If a specific company is chosen in panel 1, the map will highlight only that company (but still can show alternatives optionally).
  - Distances are computed as straight-line (Haversine) by default, with option to compute driving distance/time via routing API if available.
  - Routing lines are shown on the map when a marker is clicked. Route should be visually distinct and removable when returning to home panel.

Scope & Limitations:
In scope

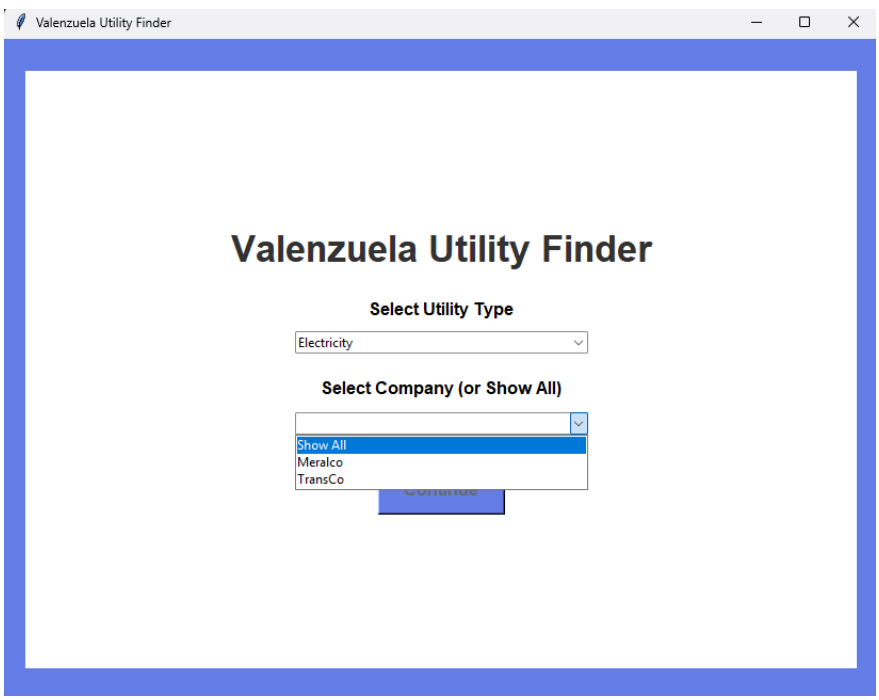
- Desktop and mobile-friendly web GUI with two main panels as specified.
- Map display with markers for user and up to three recommended companies.
- Ranking logic (nearest, 2nd, 3rd) using geographic distance; optional driving-distance ranking if routing API available.
- Simple form validation for user name fields and barangay selection.

- Routing line from current location to chosen utility marker.
- Side panel with 1st/2nd/3rd recommendations and details.
- “Find this utility” flow and a confirmation message.
- Basic logging of user queries (non-identifying summary) and metrics.

Out of scope (limitations / assumptions)

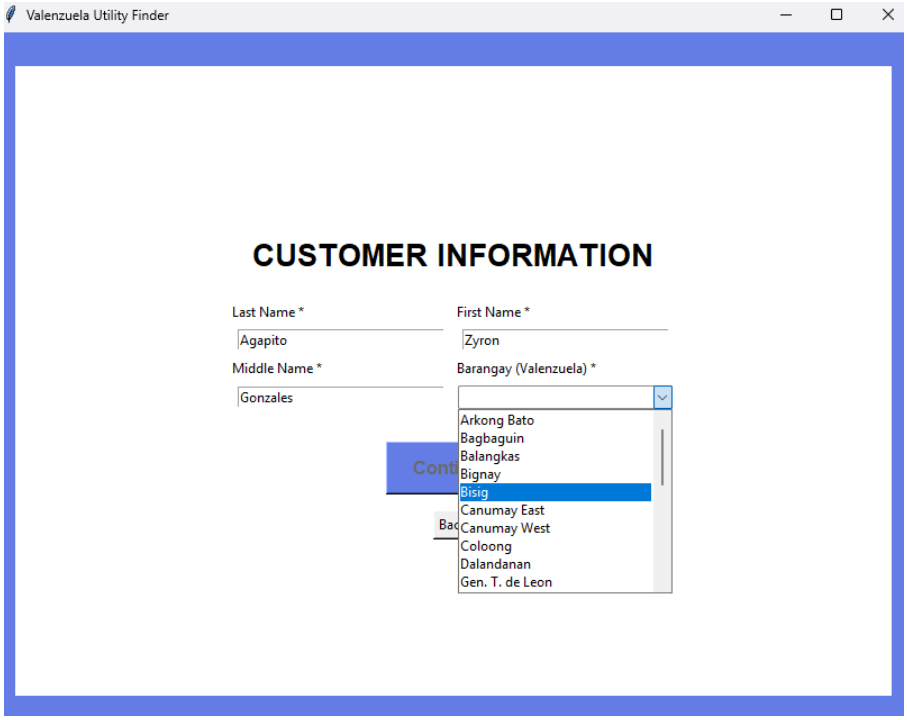
- The app does not perform real-time live availability checks of company offices (e.g., open/closed, queue length).
- No account/login system (anonymous usage). If later needed, add authentication.
- Accurate driving time depends on external routing APIs and their quota/price (not included by default).
- User location accuracy depends on device/browser GPS permissions.
- This proposal assumes company office coordinates and contact info are provided / importable (if not, a data collection step is required).
- No offline maps; internet required.
- No emergency dispatch features or access to private/utility-only systems.

Clear layout of each project screen (with explanation):
All screens are responsive. Use consistent header and a two-panel layout (left: form, right: map) on desktop; stacked on mobile.



A. Main Panel (Panel 1) — Utility & Company Selection

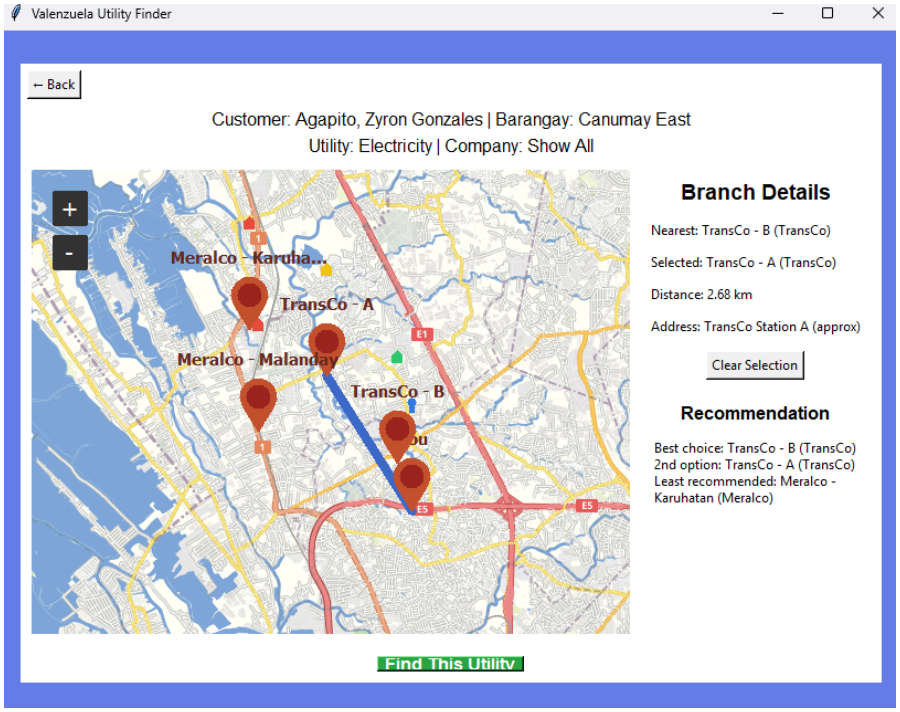
- Header: “Valenzuela Utility Finder”
- Controls (form):
  - Dropdown: Utility — options: Electricity, Water.
  - Dropdown: Company — dynamic: shows companies for selected utility plus Show All Companies.
    - Electricity: Meralco, TransCo, Show All Companies
    - Water: Maynilad, Valenzuela Water, Show All Companies
  - Button: Next (go to Panel 2)
- Behavior: When utility changes, company dropdown refreshes. Choosing Show All Companies is allowed.



B. User Details & Location Panel (Panel 2)

- Form fields:
  - Last Name (text) — required
  - First Name (text) — required
  - Middle Name (text) — optional
  - Barangay (dropdown) — 33 barangays (list provided)
- Map area: Initially centers on selected barangay; if the user grants location permissions, the blue marker indicates their current location.

- Side panel (right or bottom on mobile):
  - Top: "Recommended utilities" header
  - 3 cards: 1st (Green), 2nd (Yellow), 3rd (Red). Each shows:
    - Company name
    - Address snippet
    - Distance (meters/km)
    - Small Go/Route icon
- Map markers color scheme:
  - Blue = User current location
  - Green = Nearest recommended company
  - Yellow = Second
  - Red = Third
- Interactions:
  - Click a marker: draws a route and highlights that side-panel entry.
  - Click anywhere on map: place a temporary marker; app draws route from user location to that point.
  - Button: Find this utility (active only when a route/target is selected).



C. Confirmation & Return

- After pressing Find this utility:
  - Show toast or modal: "Thank you — the route to this utility has been found."
  - Log the selection event (user name, barangay, chosen company, timestamp — anonymize or store minimally).
  - Return to Panel 1 (clear previous selections).

D. Optional admin/maintenance view

- A protected page to add/update company coordinates, addresses, contact info; view logs and usage stats.

Main Database Content

A. UTILITIES TABLE

Table: utilities

Field	Description
id	Unique ID for each utility type
name	Name of the utility (Electricity, Water)

Sample Data

id	name
1	Electricity
2	Water

B. COMPANIES TABLE

Table: companies

Field	Description
id	Unique ID for each company
name	Company name (Meralco, TransCo, Maynilad, etc.)
address	Company address
latitude	Map latitude value
longitude	Map longitude value
contact_phone	Company phone number
notes	Optional notes or additional info

Sample Data

id	name	address	latitude	longitude	contact_phone
1	Meralco (Valenzuela)	Example St. Valenzuela	14.7012345	120.9723456	02-8xxxxxxx
2	Maynilad	Example Ave. Valenzuela	14.7101234	120.9804567	02-8xxxxxxx
3	Valenzuela Water	Example Rd. Valenzuela	14.7056789	120.9756789	02-8xxxxxxx

C. COMPANY–UTILITY LINK TABLE

Table: company_service

(Shows which company belongs to which utility)

Field	Description
id	Link ID
company_id	ID of company
utility_id	ID of utility

Sample Data

id	company_id	utility_id	Meaning
1	1	1	Meralco → Electricity
2	2	2	Maynilad → Water
3	3	2	Valenzuela Water → Water
4	4	1	TransCo → Electricity

D. Barangay's Table

	A	B	C
1	ID	Barangay	Coordinates
2	1	Arkong Bato	14.7062, 120.9691
3	2	Bagbaguin	14.7373, 120.9993
4	3	Balangkas	14.6904, 120.9360
5	4	Bignay	14.7601, 120.9927
6	5	Bisig	14.7069, 120.9705
7	6	Canumay East	14.7001, 120.9999
8	7	Canumay West	14.7033, 120.9975
9	8	Coloong	14.6931, 120.9470
10	9	Dalandanan	14.7018, 120.9631
11	10	Gen. T. de Leon	14.7150, 120.9962
12	11	Isla	14.7015, 120.9533
13	12	Karuhatan	14.7128, 120.9698
14	13	Lawang Bato	14.7649, 120.9670
15	14	Lingunan	14.7136, 120.9677
16	15	Mabolo	14.7152, 120.9616
17	16	Malanday	14.7041, 120.9602
18	17	Malinta	14.7089, 120.9712
19	18	Mapulang Lupa	14.7277, 120.9773
20	19	Marulas	14.7132, 120.9479
21	20	Maysan	14.7350, 120.9630
22	21	Palasan	14.7058, 120.9490
23	22	Pariancillo Villa	14.7053, 120.9464
24	23	Paso de Blas	14.7014, 120.9955
25	24	Poblacion	14.7045, 120.9481
26	25	Punturin	14.7331, 120.9960
27	26	Rincon	14.7100, 120.9495
28	27	Tagalag	14.6899, 120.9491
29	28	Ugong	14.7084, 120.9520
30	29	Viente Reales	14.7236, 120.9884
31	30	Veinte Reales	14.7236, 120.9884
32	31	Wawang Pulo	14.6784, 120.9354
33	32	Parada	14.7395, 120.9808
34	33	Malinta West	14.7100, 120.9730

Project Name:
School Supplies Inventory and Checkout System

Category:
Desktop Application – Inventory Management (Python + Tkinter)

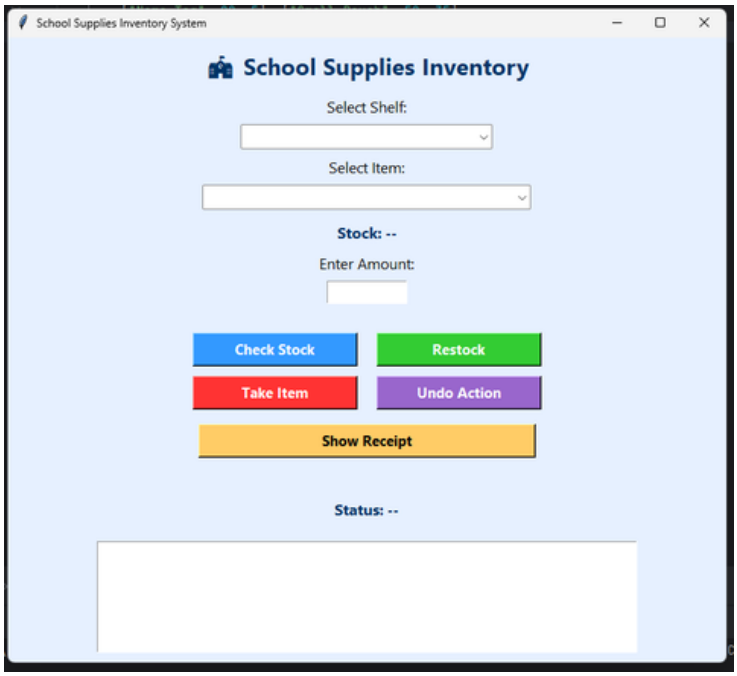
Project Description:
The School Supplies Inventory and Checkout System is a desktop-based GUI application built in Python using Tkinter.
It allows users to:
Manage shelves/categories of school supplies
View item stock and price
Restock items
Take items (simulate checkout)
Generate a receipt with computed total
Undo the last action

The system is designed for small-scale office/school supply monitoring and checkout operations.

Scope and Limitations
Scope
Displays shelves and items dynamically
Shows stock level and price per item
Allows restocking and item checkout
Generates receipts with total cost
Undo last restock/take
Color-coded status alerts (OK / Low Stock / Error)
50+ item database grouped by categories

Limitations
No user login system
No barcode scanner support
Receipt is text-only (no printable PDF unless added)
No database engine (uses in-memory dictionary, resets on restart)
No automatic saving/loading of inventory
Single-user, not cloud-based
No analytics/reporting dashboard

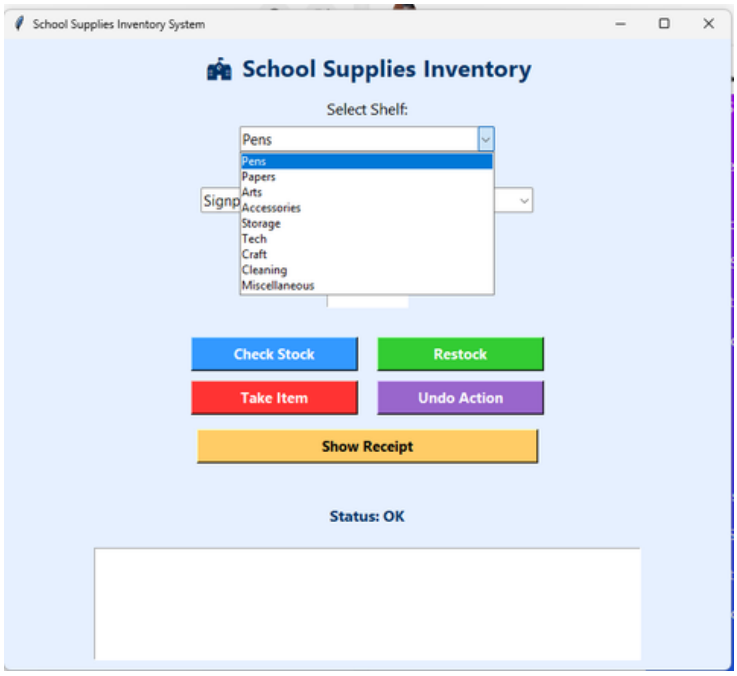
Clear Layout of Each Project Section (with explanation and outputs):
Below is the GUI layout breakdown:



A. Header / Title Area
Component:
School Supplies Inventory (Label)

Purpose:
Displays the title of the software with emphasis.

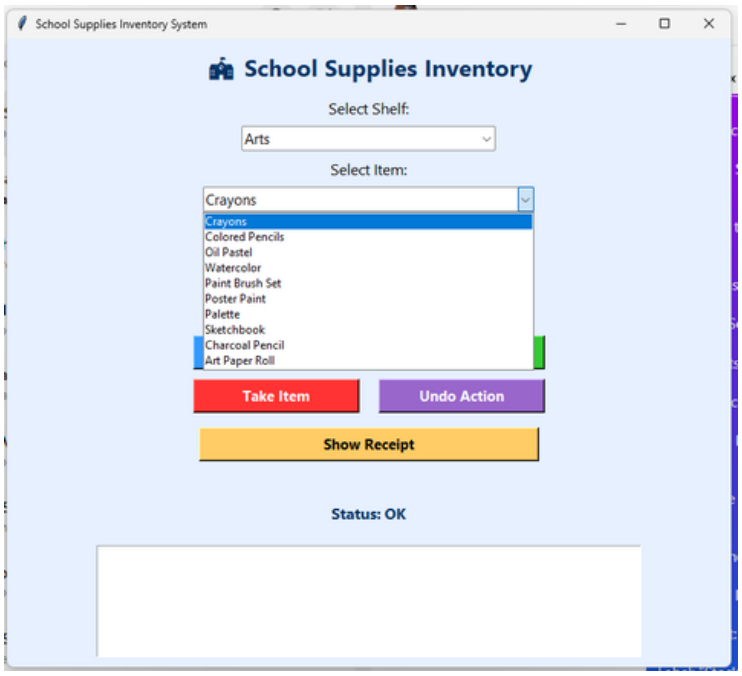
Output:
Centered bold text at the top of the window.



B. Shelf Selection Section
Components:
Label: "Select Shelf"
ComboBox: Shelf options (Pens, Papers, Arts, etc.)

Purpose:
Allows user to choose which supply area they want to access.

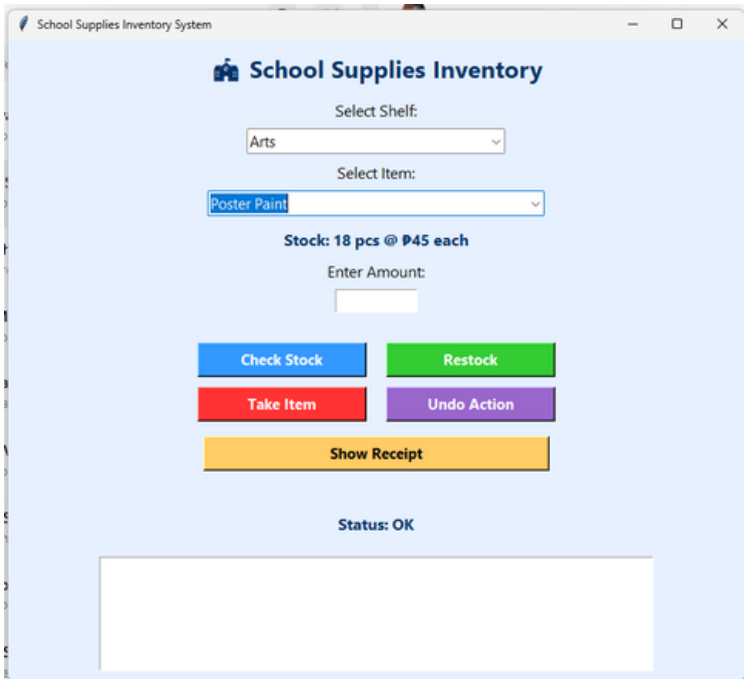
Output:
When the user selects a shelf → the item list updates automatically.



C. Item Selection Section
Components:
Label: "Select Item"
ComboBox: Items under the selected shelf

Purpose:
Displays the list of items available in the chosen shelf.

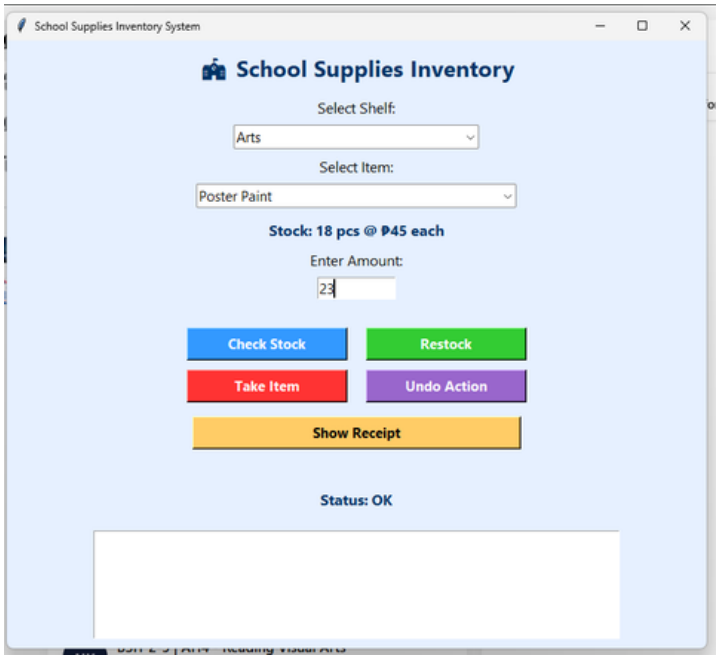
Output:
Changing the item updates the stock display.



D. Stock Information Section
Component:
Label: "Stock: --" (updates after selecting)

Purpose:
Shows stock quantity and price in real-time.

Output Example:
Stock: 45 pcs @ ₱22 each



E. Quantity Input Section
Component:
Entry box to input number (for restock or take)

Purpose:
User enters how many items to restock or take.

Error Handling:
Shows error when invalid number entered.

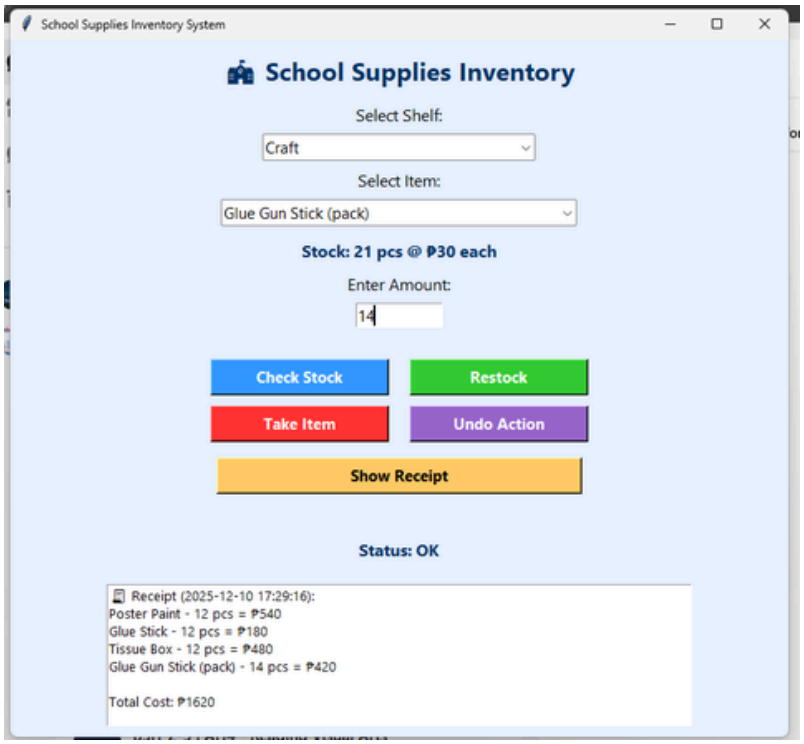
F. Action Buttons Section
Buttons include:
Check Stock - Shows updated stock and warns if low (<5).
Restock - Adds quantity to stock.

Output Example:
Restocked 10 Ballpen
Take Item
Subtracts quantity.
Adds to receipt.

Output Example:
Taken 3 Notebook

Undo Action - Restores last action (restock/take).

Show Receipt - Opens a receipt text area containing:
- item list
- Qty
- Price
- total cost



G. Receipt Output Section
Component:
Text widget (multiline output)

Purpose:
Displays purchased items with total.

Output Example:
Receipt (2025-12-10 17:45:33):
Ballpen - 3 pcs = ₱30
Notebook - 1 pcs = ₱50

Total Cost: ₱80

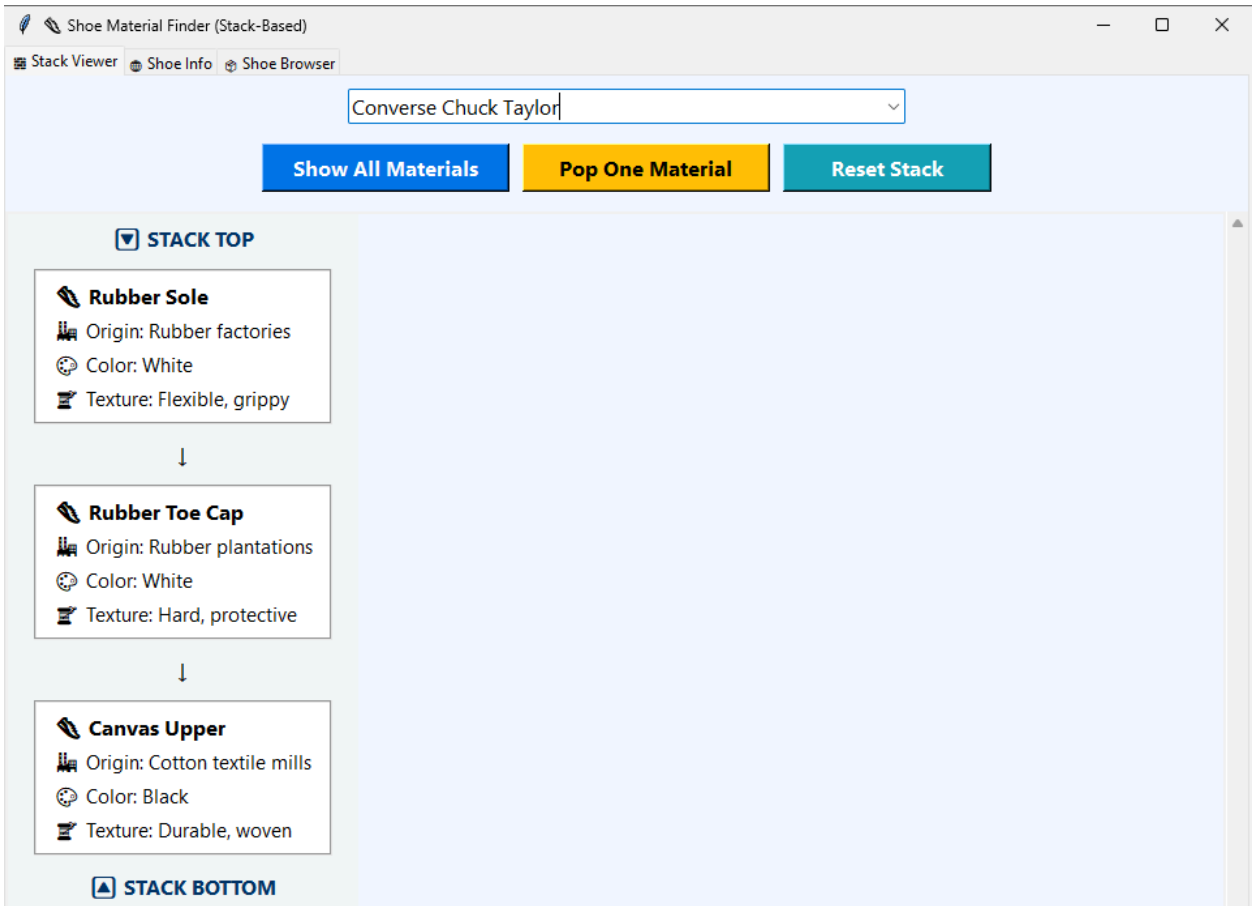
Project Name:
Shoe Material Stack Viewer



Category:
Stack

Description:
This project is a Python-based GUI application that visualizes the materials used in popular sneakers using a **stack data structure**. Users can explore how each shoe is constructed layer by layer (upper, midsole, outsole), interact with the stack (push, pop, reset), browse a searchable sneaker database, and access official product pages.

Scope and Limitation:

Scope

- Visualize shoe materials using stack operations
- Browse 50+ sneakers with detailed material metadata
- Search and preview shoes in a scrollable browser
- Open official product pages via embedded links
- Educational tool for learning stacks and product design

Limitations

- Materials are static (not dynamically scraped)
- No user-uploaded shoes or database editing
- No persistent storage (data resets on restart)
- No advanced filters (e.g. by color, texture, brand — yet!)

Clear Layout and Explanation:
